

CultTech for me complemented my previous studies in conservation and deepened my knowledge especially in the field of scientific analysis on cultural heritage. The lectures given by professionals that work in this field gave a theoretical background, as well as an insight in actual research where the taught technologies were applied. This helped a lot in the understanding of the material and was completed by the visits at renowned research institutes. For the thesis working with experts and applying the knowledge from the lectures to practical use was a good experience. The topic is chosen by the student and can be diverse, appealing to the student's strengths. We were expected to work autonomously and in groups, but help was always offered when needed. The possibility of going abroad with Erasmus was a perfect completion of the program for me.
