

CultTech Testimonial

The MSc in “Cultural Heritage Materials and Technologies” constitutes an important initiative for postgraduate studies in Greece and a major opportunity for archaeologists, conservators and other specialists interested in archaeological sciences. Its wide curriculum allows participants to familiarize themselves with most modern methods and computer software used in material and spatial analysis.

I believe that the strongest point of the CultTech programme is that it offers students the opportunity to specialize in the field of their choice during the completion of their diploma thesis. This is made possible via the cooperation with well-known research institutions like the National Center for Scientific Research “Demokritos” and the Navarino Environmental Observatory, as well as the participation of a large number of specialists.

At a personal level, the programme provided me with a useful set of skills, especially concerning the use of Geographical Information Systems, on which I focused during my thesis. Moreover, the field trips at the Navarino Environmental Observatory and the NSCSR “Demokritos” were a wonderful experience. Lastly, the scholarship offered to me was a satisfying reward for my efforts and is also an incentive for any student to pursue excellence and unfold their full potential!

Anastasios Georgotas, Academic Year 2015-2016
