

CultTech Testimonial

The Master in Science in “Cultural Heritage Materials and Technologies” allows post graduate students to specialize through compulsory modules and a dissertation or research project which is completed on a subject of our own choosing. This means that we have the opportunity to attend a program which reflects our own unique interests and which will prove interesting and intellectually rewarding.

The Master’s degree program attracted my interests because combines discipline-specific, advanced coursework with skills like critical thinking, analytic ability, and time management as well as practice work in the field and acquaintance with up to date technologies applied in Cultural Heritage for research and analysis.

Studying for this Master’s degree I gained both fresh and advanced knowledge and even confidence within my area of expertise. Graduating from the Master's program “Cultural Heritage Materials and Technologies” I obtained immense academic, intellectual and work-related skills for building a career as an archaeologist with a broad interdisciplinary background. The skills and qualities that I developed during the Master's degree will enhance my CV and help me stand out in a highly competitive graduate employment job market.

Eugenia Demiri, Academic year 2015-2016
